

.

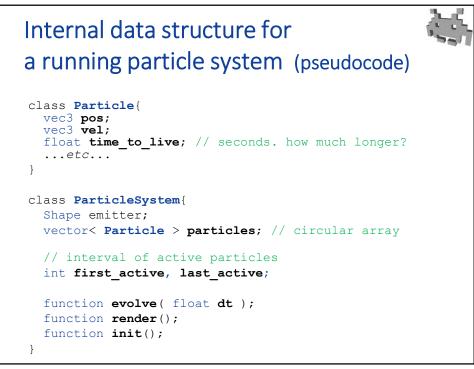

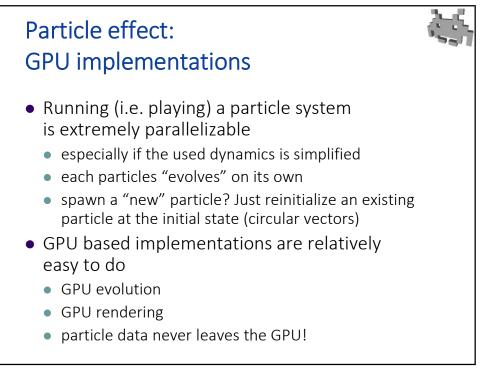

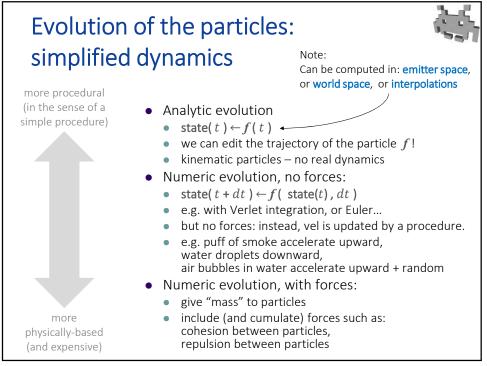

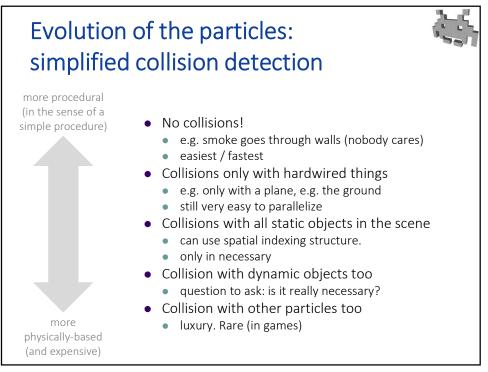

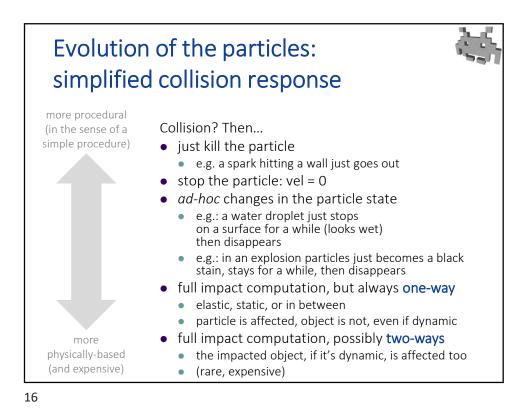

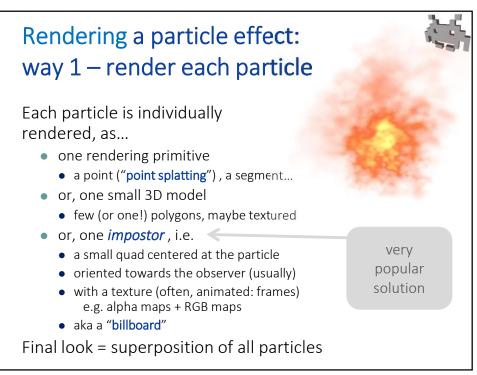

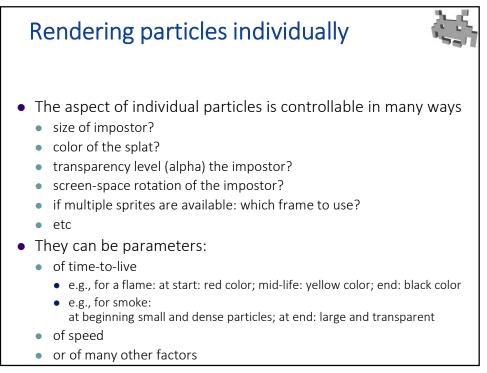

Particle effects: randomness / noise The spawning and evolution of particles typically use noise functions (pseudo randomness) Examples: the initial position is randomly selected as any point inside the emitter the initial color is selected as a random interpolation between two given colors the speed and acceleration have random components This creates differentiation and reflect the stochastic nature of the simulated phenomena Flames, etc

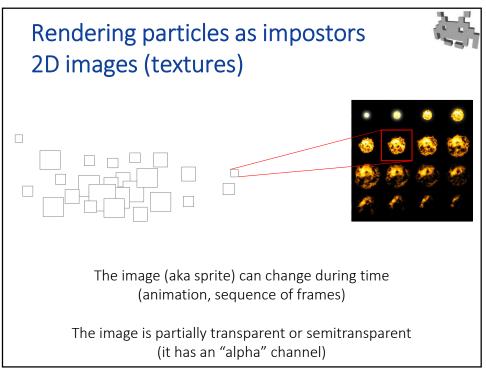

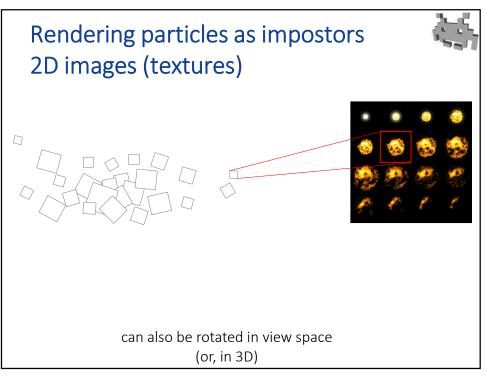

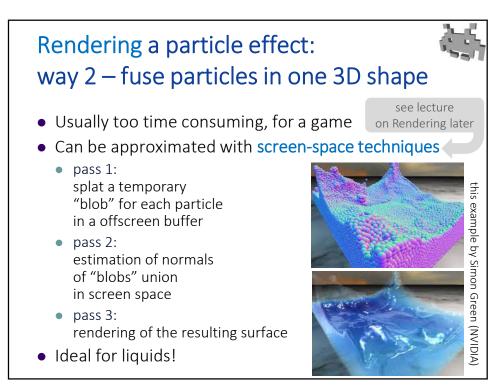

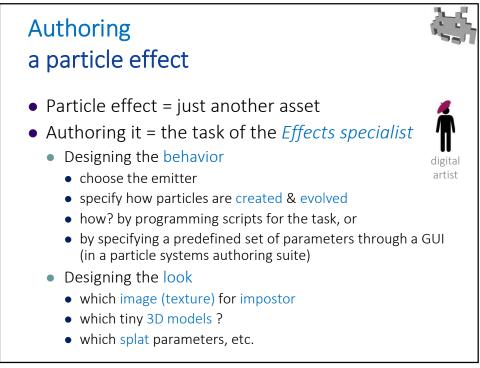

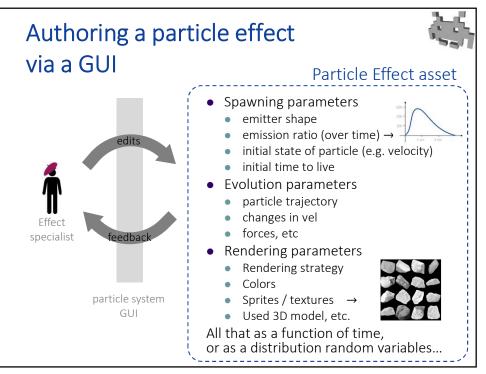

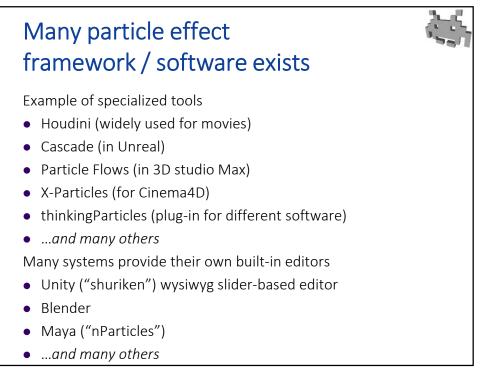

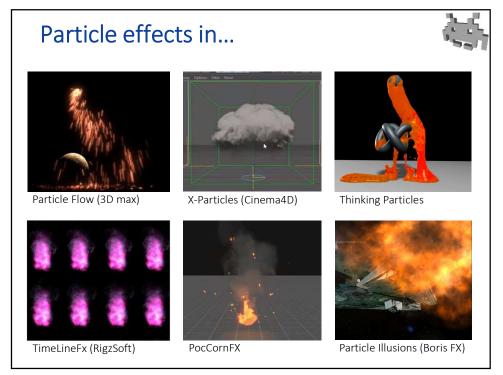

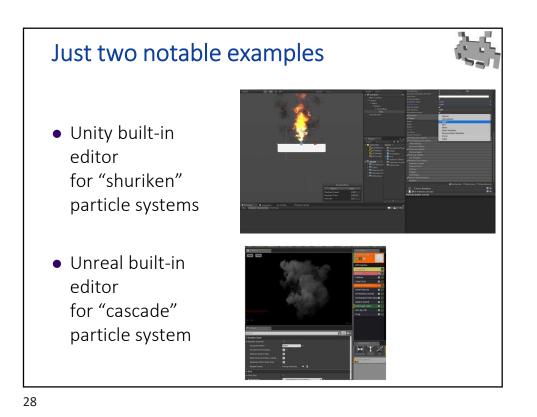

Lack of established formats for particle-effect assets
Each software suit uses its own:

set of parameters, tricks, degrees of customizability
interface to let a FX specialist author the particle system

...and file formats to store that asset. Examples:

Unity: stored as .prefabs
Unreal: "cascade" file format
Maya: .pdb .pda
Renderman: .ptc
Dudini: .geo .bgeo
