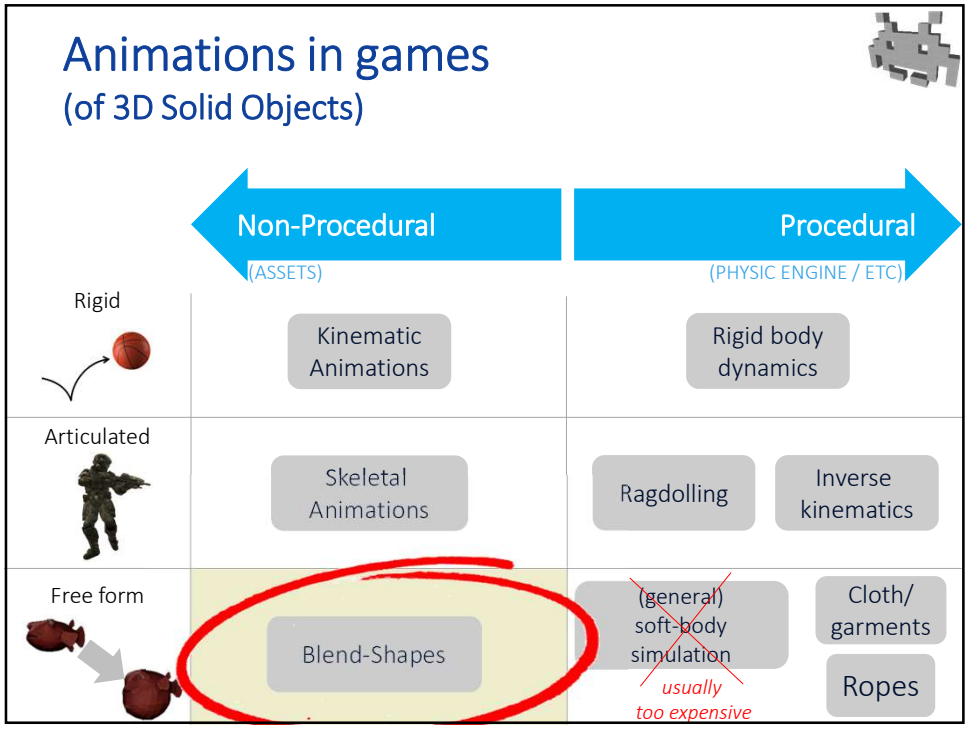
Course Plan

lec. 1: **Introduction**
lec. 2: **Mathematics** for 3D Games
lec. 3: **Scene Graph**
lec. 4: Game **3D Physics** +
lec. 5: Game **Particle Systems**
lec. 6: Game **3D Models**
lec. 7: Game **Textures**
lec. 9: Game **Materials**
lec. 8: Game **3D Animations**
lec. 10: **Networking** for 3D Games
lec. 11: **3D Audio** for 3D Games
lec. 12: **Rendering Techniques** for 3D Games
lec. 13: **Artificial Intelligence** for 3D Games

13

Animations in games
(of 3D Solid Objects)



14

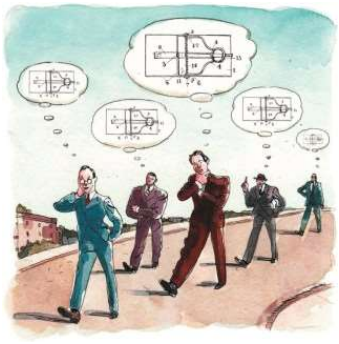
Animations in games: authored, procedural… or a mix?

- A few examples of current commonly used mixes:
  1: *"primary"* animations: authored
  "secondary" animations: physically generated
  2: *alive* characters: authored
  dead characters: physically generated ("ragdolls")
  3: walk cycle: authored (skeletal animation)
  exact *feet placement*: procedural (inverse kinematic)
  4: normal "behavior", such as sparring: authored
  gaze control during sparring: procedural
  5: normal "behaviors" such as jumping, running: authored
  modifications / transitions: AI generated
  and more!
- mixing AI-generated with authored animations is a frontier in the field of Computer Animation!

15

Asset for free-form animations: Blend-shapes

- Also known as:
  - Morph-targets
  - Face-morphs
  - Shape-keys
  - Per-vertex animations
  - Vertex-animations
  - …



BARRY BLITT (THE NEW YORKER)

16

Blend shapes: concept

Walk cycle
(Monkey Island
LucasArt 1991)

- Animation in 2D (old school) games:
  a sequence of sprites
- Animation in 3D games:
  just a sequence of meshes?

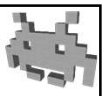
17

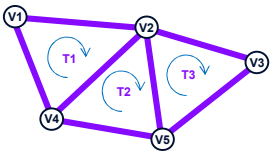
Reminder: representation of a mesh

- Indexed mode :
  - Geometry:
    - a 3D position for each vertex
  - Attributes:
    - more data, also stored in each vertex
    - (to be interpolated inside faces)
  - Connectivity:
    - Array of triangles (faces)
    - Each triangle = a triplet of indexes to vertex

18

Mesh (data structure)





connectivity (indexed)

Tri:	Wedge 1:	Wedge 2:	Wedge 3:
T1	V4	V1	V2
T2	V4	V2	V5
T3	V5	V2	V3

geometry:

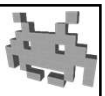
Vert:	Pos
V1	(x, y, z)
V2	(x, y, z)
V3	(x, y, z)
V4	(x, y, z)
V5	(x, y, z)

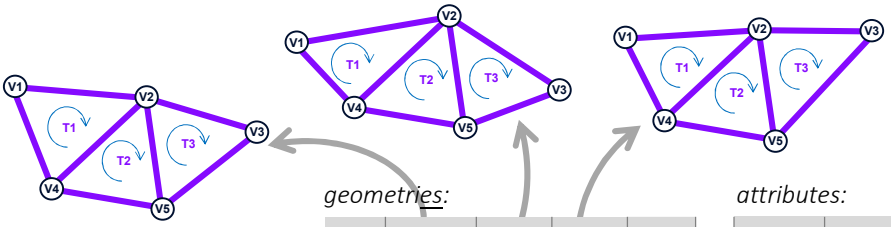
attributes:

UV	Col
(u, v)	(r, g, b)
(u, v)	(r, g, b)
(u, v)	(r, g, b)
(u, v)	(r, g, b)
(u, v)	(r, g, b)

19

Blend shapes (data structure)





connectivity (indexed)

Tri:	Wedge 1:	Wedge 2:	Wedge 3:
T1	V4	V1	V2
T2	V4	V2	V5
T3	V5	V2	V3

geometries:

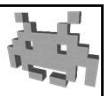
Vert:	Base Shape	Shape 1	Shape 2	…
V1	(x, y, z)	(x, y, z)	(x, y, z)	…
V2	(x, y, z)	(x, y, z)	(x, y, z)	…
V3	(x, y, z)	(x, y, z)	(x, y, z)	…
V4	(x, y, z)	(x, y, z)	(x, y, z)	…
V5	(x, y, z)	(x, y, z)	(x, y, z)	…

attributes:

UV	Col
(u, v)	(r, g, b)
(u, v)	(r, g, b)
(u, v)	(r, g, b)
(u, v)	(r, g, b)
(u, v)	(r, g, b)

20

Blend shapes



- A mesh with several associated geometries
- I.e. a sequence of meshes ('shapes') with
  - shared connectivity
  - many shared attributies
    - except normals / tangents dirs
    - shared UV-map, per vertex colors…
  - different geometries
  - (and shared textures as well)

aka 'morph'
aka 'morph-target'
aka (key)-'frame'
aka 'shape-key'

- Variants (they are equivalent):
  - Relative mode:
    - *base shape*: stored as per-vertex positions (points)
    - any other *shape*: stored as difference with *base shape* (vectors)
  - Absolute mode:
    - each *shape* stored as per-vertex positions (points)

21

Blend shapes
(as a data structure, e.g. C++)

- Indexed mesh :

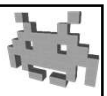
```
class Vertex {
  vec3 pos;
  rgb color;
  vec3 normal;
};

class Face{
   int vertexIndex[3];
};

class Mesh{
  vector<Vertex> vert; /* geom + attr */
  vector<Face> tris;   /* connectivity */
};
```

22

Blend shapes
(as a data structure, e.g. C++)



- Blend-shape :

```
class Vertex {
  vec3 pos [ N_SHAPES ] ;
  rgb color;
  vec3 normal [ N_SHAPES ] ;
};

class Face{
   int vertexIndex[3];
};

class Mesh{
  vector<Vertex> vert; /* geom + attr */
  vector<Face> tris;   /* connectivity */
};
```

23

Blend-shapes:
most common interchange formats

- Format supporting blend-shapes inlcude:
  - .GLTF (Khronos)
    "morphTarget", relative encoding
  - .DAE (Collada)
  - .FBX (Autodesk)
- Older / simpler alternatives:
  - .MD5 ("quake", valve)
  - or, just store a sequence of meshes (es .OBJ)
    - making sure connectivity is coherent!
      (vertex, face ordering must be the same – can be tricky)

24

Uses of Blend-Shapes: facial expressions

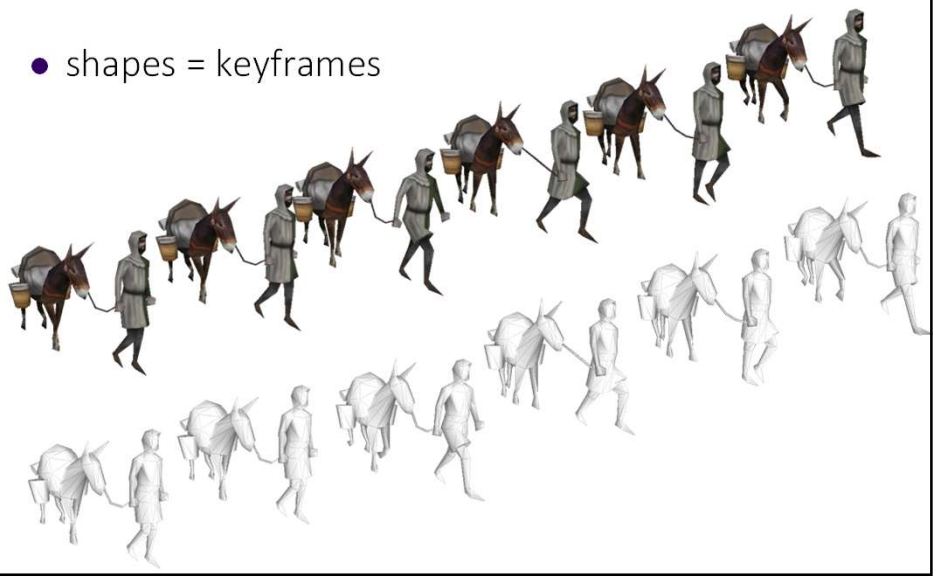
shape A shape B

here: shapes = facial expressions
(typical use; that's why they are also called "face morphs"

25

Uses of Blend shapes: temporal sequences

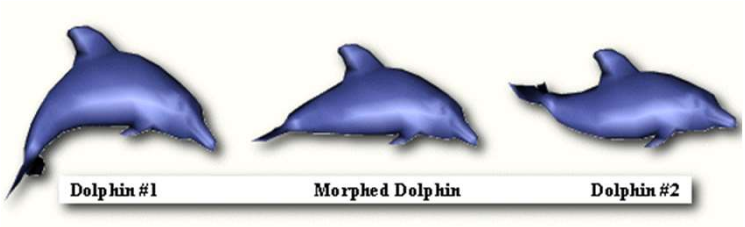
- shapes = keyframes



26

Uses of Blend shapes: temporal sequences

- Temporal sequences
  - shapes = keyframes



27

Blending keyframes of a temporal sequence

- shapes = keyframes of the animation
  - shape_A with time t_A
  - shape_B with time t_B
  - shape_C with time t_C
  - shape_D with time t_D
- given current time t with $t_B \leq t \leq t_C$
- *then...*
  - which shapes to blend? shape_B , shape_C
  - weights? $w_B = \frac{t - t_C}{t_B - t_C}$ $w_C = (1 - w_B) = \frac{t - t_B}{t_C - t_B}$

28

Blending keyframes of a temporal sequence with transition functions

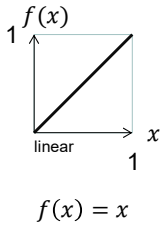
- shapes = keyframes of the animation
  - shape_A  with time t_A
  - shape_B  with time t_B
  - shape_C  with time t_C
  - shape_D  with time t_D
- given current time t with $t_B \leq t \leq t_C$
- *then…*
  - which shapes to blend? shape_B , shape_C
  - weights? $w_B = f\left(\frac{t - t_C}{t_B - t_C}\right)$ $w_C = (1 - w_B)$

transition function

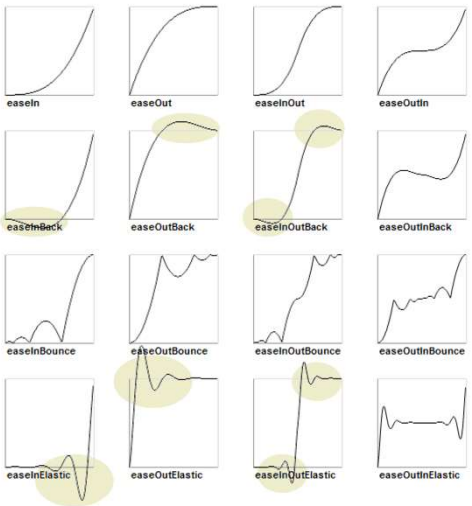
29

Transition functions
(applies to all animation types with keyframes)

- Not necessarily the Linear one



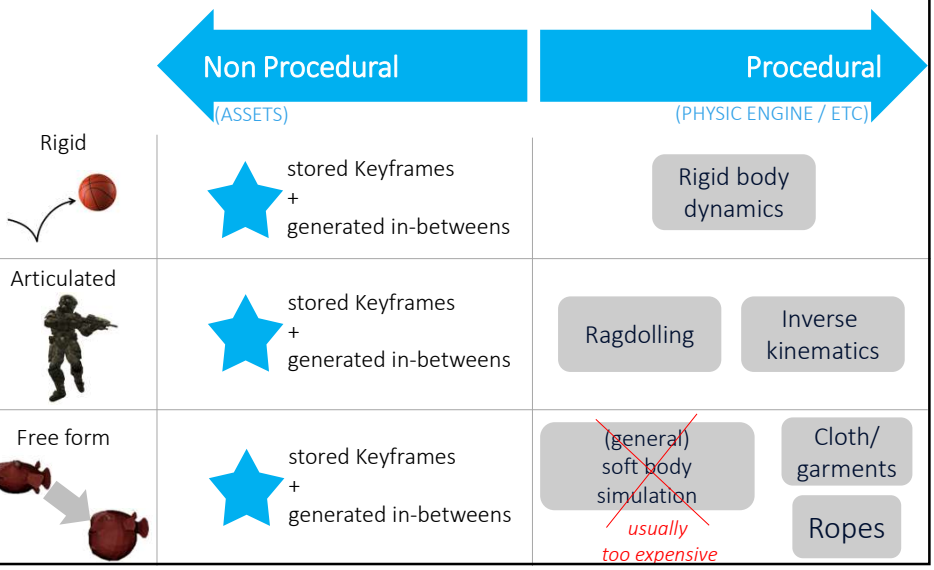
$f(x) = x$



NB: = extrapolation !
i.e. exaggeration

31

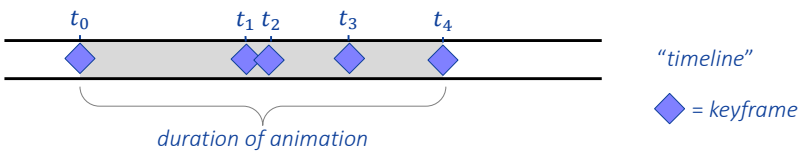
Keyframes and inbetweening



32

Keyframes and in-betweens: notes
(applies to *all kinds* of asset animations)

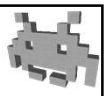
- The animation asset stores only a subset of the frames ("key"-frames)
  - each with its own associated *time*



- Other frames ("in-betweens") are interpolated keyframes
  - saves storage RAM (only keyframes are stored)
  - saves artist work (only keyframes are constructed)
  - animation can very smooth (avoids temporal aliasing)
    e.g., even when played at extreme slow-motion
  - this implies the ability to *interpolate* key-frames!

33

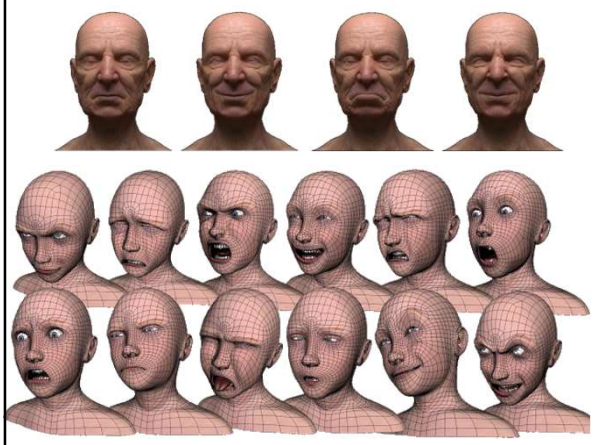
Keyframes and in-betweens: notes
(they apply to *all kinds* of asset animations)

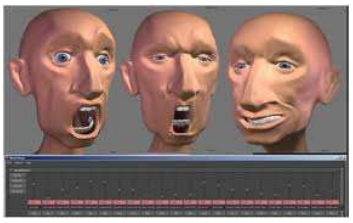


- keyframes distribution (the "temporal resolution" of the animation) can be *adaptive*
  - more keyframes only where needed
- in-betweening happens on demand
  - e.g., at each refresh of video
- *times* associated to keyframe are arbitrary
  - not necessarily an integer number of video frames
  - all frames shown on screen will be in-betweens
- the better the interpolation schema
  → better in-betweens → fewer keyframes are needed
- editing the animation: (asset)
  - editing individual keyframes
  - editing keyframe *times* (e.g., to achieve non-linearity of moment, vary speed)
  - 1. pick a new time t_i (not a keyframe)
    2. bake the in-between at *t* as a new keyframe
    3. edit it!

34

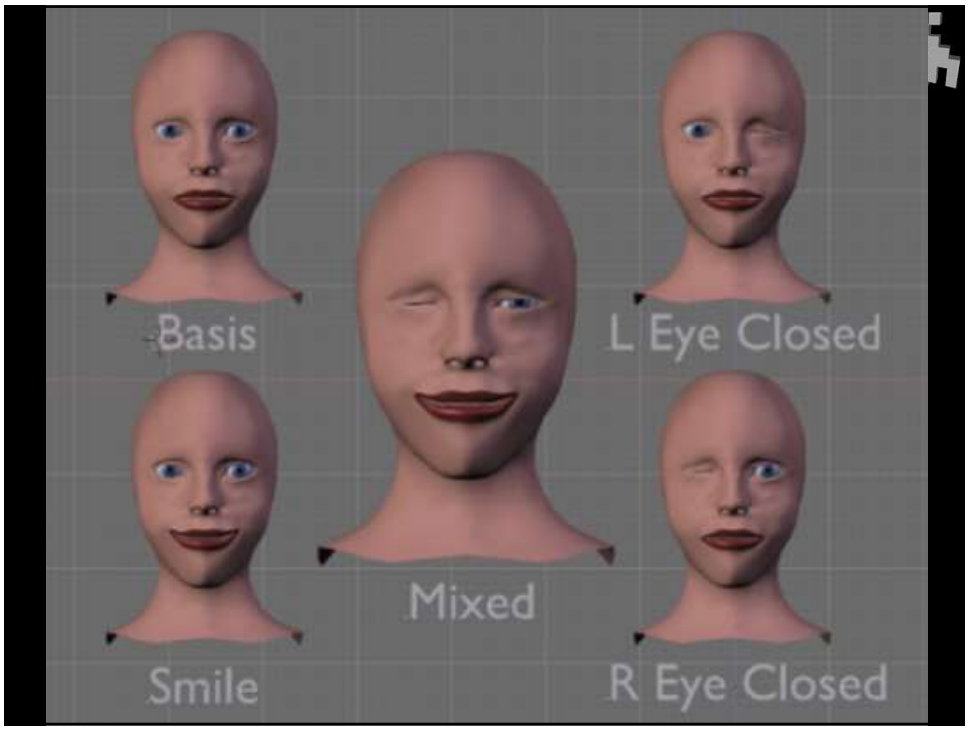
Uses of Blend shapes: facial animations





Here, used together with skeletal animations (see next lecture)
(for mandible, neck, eyeballs)

37



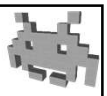
38

Blending shapes of a blend-shape

		using Absolute Encoding	using Relative Encoding
What is stored		base shape (positions), shapes (positions): $S_b , S_0 , S_1 , S_2 \ldots$ ($S_b + R_0$, $S_b + R_1$)	base shape (positions), shapes (vectors): $S_b , R_0 , R_1 , R_2 \ldots$ ($S_0 - S_b$, $S_1 - S_b$)
Equivalent ways to blend...	two shapes i and j	$w_i S_i + w_j S_j$	$S_b + w_i R_i + w_j R_j$
	three shapes i,j and k	$w_i S_i + w_j S_j + w_k S_k$	$S_b + w_i R_i + w_j R_j + w_k R_k$
	etc	with $\Sigma w = 1$	

39

Blending shapes of a blend-shape



What is stored		base shape (positions), shapes (positions): $S_b , S_0 , S_1 , S_2 \dots$ ($S_b + R_0$, $S_b + R_1$)	base shape (positions), shapes (vectors): $S_b , R_0 , R_1 , R_2 \dots$ ($S_0 - S_b$, $S_1 - S_b$)
Equivalent ways to blend...	base shape with one shape i	$(1 - w)S_b + w\, S_i$	$S_b + w\, R_i$
	base shape with two shapes (i,j)	$(1 - w_i - w_j)S_b + + w_i\, S_i + w_j\, S_j$	$S_b + w_i\, R_i + w_j\, R_j$
	base shape with three shapes	$(1 - w_i - w_j - w_k)S_b + w_i\, S_i + w_j\, S_j + w_k\, S_k$	$S_b + w_i\, R_i + w_j\, R_j + w_k\, R_k$
~~$\Sigma w = 1$~~		using Absolute Encoding	using Relative Encoding

40

Blending shapes of a blend-shape: notes

- The two ways to store a bland-shape are equivalent
  - They can achieve the same set of morphed shapes
  - Note: when Σw_i=1 the formula for absolute is simpler
  - Note: when Σw_i>1 it becomes an extrapolation (beware)
- The absolute way is more natural when shapes are designed to be used as *alternatives* (and Σw_i=1)
  - Examples: keyframes of an animation sequence
- The relative way is more natural when shapes are designed to be *superimposed* with various degrees of strength. E.g.:
  - $shape_0$ = close left eye
  - $shape_1$ = smile
  - $shape_0$ + $shape_1$ = wink
  - $shape_0$ = fat
  - $shape_1$ = long chin
  - 0.4 $shape_0$ + 0.9 $shape_1$ = a bit fat & quite long chin

41

45

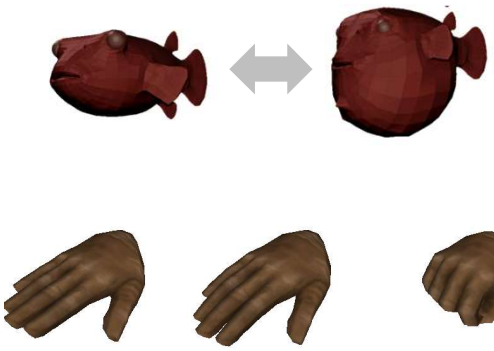
Using facial animations as Blend shapes

- 3D Modeller authors:
  produces the blend-shapes (aka: the “facial rig”)
- Animator (of expressions) picks:
  weights
  - eg.: with sliders
  - assisted / substituted by automatisms
    - e.g., lip sync
    - e.g., dynamically determined expressions
- Key-shape Blending: task of the rendering engine

46

Uses of Blend-Shapes: generic deformations

- Baked poses



47

Uses of Blend-Shapes: variants of one given object

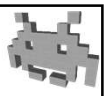
- mixable!

masculine outfit

feminine outfit

48

Uses of Blend-Shapes
variants of one given object



- mixable!

human *orc* *goblin* *dwarf*

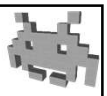
49

Uses of Blend-Shapes

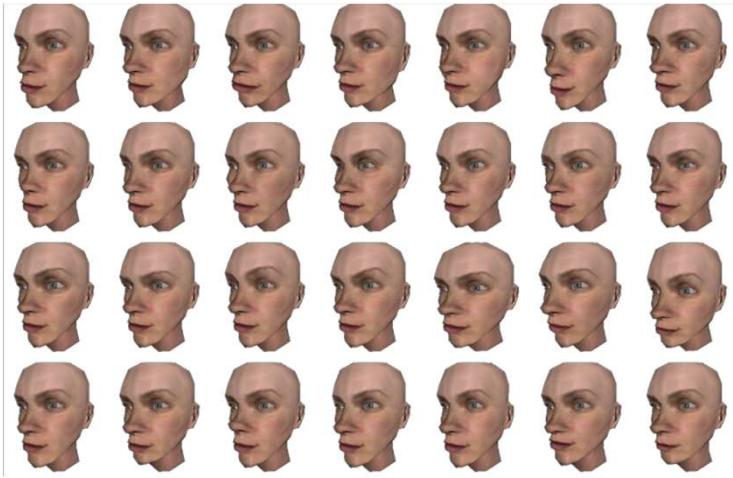
- Defines shapes of a class of objects
  - get a shape in the class = just choose the weights
    - 3D modelling at a high-level of abstraction
  - the weights "span" one shape space
    - one given shape = one point in the space
    - weights = coords
  - the space is the more useful the more:
    - *all and only* the reasonable shapes are represented in the space
- Typical Example: face morphologies
  - "face-space"
  - note: face morphology ≠ facial expression

50

Uses of Blend shapes



- A blend shape modelling a face space ("face-morphs")



51

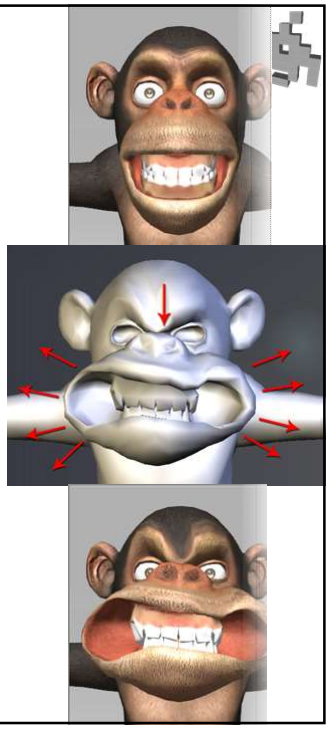
All morph-shape share… (so, a blend-shape *cannot* change)…

- The mesh connectivity
  - Eg. no change mesh res, remeshing
- Therfore, the surface topology
  - E.g. no breaking apart, fusing parts
- The mesh attributes
  - Such as color, UV-map…
  - Exceptions: positions, normals
- The textures
  - Use a texture animation instead?

52

Blend shapes: authoring

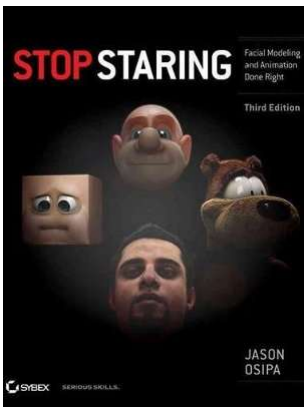
1. Editing base shape
   - including:
     uv-mapping, texturing, etc.
2. Re-edit it
   for each shape-key!
   …while preserving:
   connectivity,
   textures, etc:
   - with low poly editing
   - or with subdivision surfaces…
   - or with parametric surfaces…
   - or with scupting.



53

Blend shapes: authoring

- Handbook for blend-shape based face animation:
  - "Stop Staring" (3d edition) Jason Osipa
  - Covers: style, expression…
  - Non technical (high level)
  - Not about specific tools e.g. Blender, Maya



54

Blend shapes: pros and cons

- During authoring:
  - 👍 flexible, expressive, huge number of DOF… (too many?)
  - 👎 work intensive to construct
  - 👎 expensive to store
- During use (by animator)
  - 👍 easy to use (just define global weights)
  - 👎 RAM cost
  - 👎 very little degree of freedoms (too few?)

but, not as bad as old sprites,

because
(1) shared of connectivity, textures, attributes
(2) keyframes / inbetweens!

56

Blend shapes: open challenges

- Capturing:
  - from a stream of meshes
  - e.g. : from a RGBD camera (like Microsoft Kinect) to a blend-shape: difficult!
- Compression
  - e.g.: reduce number of keyframes (can you think of an algorithm?)
- Streaming
  - server sends animation to client while it runs
- LOD-ding
  - like for meshes (but more difficult)

57
